

Hospitality Analytics – Revenue & Booking Analysis

Problem Statement

The hospitality industry generates large volumes of booking, revenue, occupancy, and customer data on a daily basis. Hotel management teams often face challenges in understanding booking trends, cancellation patterns, occupancy rates, and revenue performance across different properties. Without effective analysis, it becomes difficult to optimize pricing, improve customer satisfaction, and maximize profitability.

This project focuses on analyzing hospitality data to evaluate hotel performance through key metrics such as revenue, occupancy rate, booking trends, average rating, and cancellation behavior. The goal is to transform raw operational data into actionable insights that support strategic decision-making and business growth.

Project Objectives

- Clean and prepare hospitality datasets for analysis.
- Analyze booking patterns across hotels and room categories.
- Measure key performance indicators such as Revenue, Occupancy Rate, ADR, and RevPAR.
- Identify major reasons and trends behind booking cancellations.
- Evaluate customer ratings and satisfaction levels.
- Build interactive Power BI/Tableau dashboards for business reporting.

Expected Outcomes

The project provides valuable insights into hotel operations, highlights factors affecting occupancy and revenue, identifies opportunities to reduce cancellations, and supports data-driven decisions to improve profitability and customer experience.
